

## **LISTING OF THE CLAIMS**

The listing of claims provided below replaces all prior versions of the claims in the application. Please amend the claims as follows:

- 1-3. (Canceled)
4. (Currently Amended) The child seat of claim [[1]] 36, wherein the latch is configured to bend when contacted by a part of the release mechanism.
5. (Previously Presented) The child seat of claim 4, wherein the part of the release mechanism includes a wedge positioned to contact the latch.
6. (Currently Amended) The child seat of claim [[1]] 36, wherein the release mechanism includes a handle that is selectively movable to disengage the latch from the notch.
7. (Previously Presented) The child seat of claim 6, further comprising an elongate rail connected to the handle and adapted to contact the latch and disengage the latch from the notch.
8. (Currently Amended) The child seat of claim [[1]] 36, wherein the latch is biased toward engagement with one of the notches.
9. (Previously Presented) The child seat of claim 8, wherein the latch is elastically deformed when disengaged from the notch.
- 10-20. (Canceled)

21. (Withdrawn) The child seat of claim 6, wherein the handle is located on the top portion of the backrest and is configured to move downward to disengage the latch from the notch.

22. (Withdrawn) The child seat of claim 21, wherein the handle is connected to a slidable rail positioned to contact the latch when the handle moves downward.

23. (Withdrawn) The child seat of claim 22, whereon one end of the rail includes a wedge shaped surface positioned so that when the handle moves downward the latch slides along the wedge shaped surface thereby disengaging from the notch.

24-28. (Canceled)

29. (Currently Amended) The child seat of claim ~~[[1]]~~ 36, wherein the latch is bendable and the release mechanism has a rail that is arranged to slide on the backrest into contact with the latch to thereby force the latch to bend and disengage from the notch.

30. (Previously Presented) The child seat of claim 29, wherein the release mechanism includes a handle connected to the rail.

31. (Previously Presented) The child seat of claim 30, wherein the handle is configured to be moved downward toward a base of the child seat to disengage the latch from the notch.

32. (Previously Presented) The child seat of claim 29, wherein the top portion of the backrest slides in a guide section of the bottom portion.

33. (Previously Presented) The child seat of claim 29, wherein the rail includes a ramped surface positioned so that when the latch contacts the rail, the latch slides along the ramp to disengage from the notch.

34. (Canceled)

35. (Currently Amended) The child seat of claim ~~[[1]]~~ 36, wherein the release mechanism is adapted to be moved into contact with the latch to disengage the latch from the notch.

36. (New) A child seat comprising:

a backrest having a top portion and a bottom portion, each of the top portion and the bottom portion having a support surface to engage and support a portion of an occupant's body, the top portion being movably connected to and vertically adjustable relative to the bottom portion,

a flexible latch on one of the top and bottom portions;

notches located in the other of the top and bottom portions, wherein the latch is positioned to engage a selected one of the notches to fix the relative vertical position of the top portion to the bottom portion; and

a release mechanism configured to selectively disengage the latch from the notch.

37. (New) A child seat comprising:

an adjustable backrest having a top portion and a bottom portion, each of the top portion and the bottom portion having a support surface to contact and support a portion of an occupant's back, the top portion being movably connected to the bottom portion to permit selective adjustment of the top portion vertically upward or downward relative to the bottom portion,

a flexible latch connected to one of the top and bottom portions;

a series of notches located in the other of the top and bottom portions, the notches corresponding to vertically selectable height positions of the top portion relative to the bottom portion, wherein the latch is positioned to engage a selected notch corresponding to a selected height position to fix the top portion relative to the bottom portion; and

a release mechanism adapted to selectively disengage the latch from the selected notch to enable movement of the latch upward or downward to another of the series of notches.
